Variables are containers for data. Python is dynamically typed, so you don't need to specify the data type explicitly.

Common data types

Numeric types: `int`, `float`, `complex`

Text type: `str`

Boolean: `bool`

Collections

`list`, `tuple`, `dict`, `set`

Example: `python name = "Alice" age = 25 height = 5.6 is_student = True`

Operators and Expressions

Python supports various operators:

Arithmetic: `+`, `-`, `*`, `/`, `%`, `//`, `**`

Comparison: `==`, `!=`, `>`, `<`, `>=`, `<=`

Logical: `and`, `or`, `not`

Control Structures

Control structures allow you to dictate the flow of your program.

Conditional Statements

Example: `python if age > 18: print("Adult") else: print("Minor")`

Loops

Example: `python for i in range(5): print(i) while age < 30: print("Learning Python!") age += 1`

Functions and Modules

Defining Functions

Functions are blocks of reusable code. Use the `def` keyword:

Example: `python def greet(name): return f'Hello, {name}!' print(greet("Alice"))`

Benefits include code reuse and improved organization.

Using Modules and Libraries

Python has a vast standard library and a rich ecosystem of third-party modules.

Importing modules

Example: `python import math print(math.sqrt(16))`

Installing external libraries

Use pip: `bash pip install requests`

Using libraries for real-world tasks

For example, fetching web data with `requests`:

Example: `python import requests response = requests.get('https://api.github.com') print(response.json())`

Data Structures in Python

Lists

Ordered, mutable collections:

Example: `python fruits = ["apple", "banana", "cherry"] fruits.append("orange") print(fruits)`

Tuples

Immutable sequences:

Example: `python coordinates = (10.0, 20.0)`

Dictionaries

Key-value pairs:

Example: `python person = {"name": "Alice", "age": 25} print(person["name"])`

Sets

Unordered collections of unique elements:

Example: `python numbers = {1, 2, 3, 2, 1} print(numbers)` Outputs {1, 2, 3}

File Handling and Input/Output

Reading and Writing Files

Reading a file: `python with open('file.txt', 'r') as file: content = file.read() print(content)`

Writing to a file: `python with open('file.txt', 'w') as file: file.write("Hello, File!")`

Getting User Input

Example: `python name = input("Enter your name: ") print(f'Welcome, {name}!')`

Object-Oriented Programming (OOP) in Python

Creating Classes and Objects

Python supports classes:

Example: `python class Person: def __init__(self, name, age): self.name = name self.age = age def greet(self): print(f'Hi, I'm {self.name}') person1 = Person("Alice", 25) person1.greet()`

Features of OOP in Python

Encapsulation, Inheritance, Polymorphism, Abstraction

Debugging and Error Handling

Common Errors

SyntaxError: typos or incorrect syntax

NameError: undefined variables

TypeError: incompatible data types

Using Try-Except Blocks

Example: `python try: result = 10 / 0 except ZeroDivisionError: print("Cannot divide by zero!")`

Proper error handling ensures your programs run smoothly even when unexpected issues occur.
